

# The OChemDb software

Nicola Corriero

Institute of Crystallography - Cnr - Bari

# Why

A very important step in the solution process of a newly determined crystal structure is the check of the final refined structure model, specifically in terms of bond lengths, bond and torsion angles.

# Why

A very important step in the solution process of a newly determined crystal structure is the check of the final refined structure model, specifically in terms of bond lengths, bond and torsion angles. This step is fundamental not only for a deep comprehension of the molecular geometry from which a precise understanding of the structure-property relationships of the compound under study can derive, but also for depositing data and publishing the structure solution.

# Other

Among the crystallographic databases which store solved crystal structures, we mention The Cambridge Structural Database (CSD).

# Other

Among the crystallographic databases which store solved crystal structures, we mention The Cambridge Structural Database (CSD).

It is a fully retrospective historical archive of small-molecules, organic and metal-organic crystal structures, in continuous growth, now storing data for over 900.000 entries.

# Other

Among the crystallographic databases which store solved crystal structures, we mention The Cambridge Structural Database (CSD).

It is a fully retrospective historical archive of small-molecules, organic and metal-organic crystal structures, in continuous growth, now storing data for over 900.000 entries.

Its extensive associated software system, which is commercial, provides several user-friendly tools and multiple functions for searching the database, analysing its entries and displaying structures.

# Our solution

The Open Chemistry Database (OChemDb) is a new free web portal which has been developed for assisting in the crystal structure determination process by surveying on bond distances, bond angles, torsion angles, atom types and space groups. It uses a suitably designed database of solved crystal structures.

# Our solution

The Open Chemistry Database (OChemDb) is a new free web portal which has been developed for assisting in the crystal structure determination process by surveying on bond distances, bond angles, torsion angles, atom types and space groups. It uses a suitably designed database of solved crystal structures.

The use of OChemDb requires only a web browser and an internet connection. Every device (mobile or desktop) and every operating system is able to use OChemDb by accessing to its web page.

# Our solution

The Open Chemistry Database (OChemDb) is a new free web portal which has been developed for assisting in the crystal structure determination process by surveying on bond distances, bond angles, torsion angles, atom types and space groups. It uses a suitably designed database of solved crystal structures.

The use of OChemDb requires only a web browser and an internet connection. Every device (mobile or desktop) and every operating system is able to use OChemDb by accessing to its web page.

**OChemDb is free for academic and non-profit research institutions.**

# Data source

Crystallography Open Database (COD) includes entries in CIF format. Currently there are more than 412558 entries in the COD. Their number is continually growing.

We generated data (distances, angles, torsions,...) from COD CIF files by using new ad-hoc functions written in EXPO2014.

Open-access collection of crystal structures of organic, inorganic, metal-organic compounds and minerals, excluding [biopolymers](#).

Including data and [software](#) from [CrystalEye](#), developed by Nick Day at the [Department of Chemistry](#), the University of Cambridge under supervision of [Peter Murray-Rust](#)

All data on this site have been placed in the public domain by the contributors.

Currently there are **395548** entries in the COD.  
Latest deposited structure: [202187](#) on 2018-06-18 at 15:53:49 UTC

# Implementation

The interactive web interface has been designed with a variety of query options and has made the search efficient by incorporating auto-complete dropdown boxes and graphical tools to draw molecule.

- jQuery, Bootstrap
- Php, Mysql
- OpenBabel, CDK, JSME, JSMOL

# Implementation

The interactive web interface has been designed with a variety of query options and has made the search efficient by incorporating auto-complete dropdown boxes and graphical tools to draw molecule.

- jQuery, Bootstrap
- Php, Mysql
- OpenBabel, CDK, JSME, JSMOL

In the first version of OChemDb we have

- 54 millions of bond angle values
- 26 millions of bond distance values
- 5 millions of bond torsion values
- 1 million of atom types

The proposed database will be updated at regular intervals.

# Software Available

The software packages currently developed at IC are:

- SPARK** – a widely used package for the structure refinement of small single-crystal structures using either X-ray or electron diffraction data. It is also included in **LSMLINK**.
- LSMLINK** – a state-of-the-art computer program devoted to produce crystal structure determinations by X-ray crystallography. The package currently contains the program **LSQABS** for the determination and refinement of small structures.
- LSQABS** – an integrated package for the indication of a powder diffraction pattern, the extraction of indexed reflections, the space group determination, the crystal structure solution via direct methods and/or a direct space approach, and the structure refinement by the Rietveld technique.
- LSQABS** – a computer program for phase identification using powder diffraction data.
- Quintax** – a Rietveld program for quantitative phase analysis of polycrystalline mixtures from powder diffraction data.
- LSQABS** – a suite of programs for the *super- and sub-resolution* of X-ray imaging of nano and biomaterials with SAXS, WAXD, GRAXAS and GRAXAS refinements.
- LSQABS** – An interactive, general purpose tool for processing unidimensional profiles with specific applications to X-ray diffraction measurements.
- LSQABS** – an *in-situ* profile, using an *aggregately defined database of already solved crystal structures*, for searching and analyzing crystal-chemical information of organic, metal-organic and inorganic structures, and providing statistics on desired bond lengths, bond angles, torsion angles, and space groups.

The software is free for academic and non-profit research institutions, while it requires the payment of a license fee to commercial users.

To download the software packages, after completing the terms and conditions of the web-site, choosing the software packages of their interest and accepting all the terms and conditions of the on-line Academic License Agreement, after accepting the registration, users will receive a confirmation e-mail and will be allowed instantly to download the selected software.

# Distance

A chemical bond distance between two elements can be sought in the database by selecting and evaluating all the crystal structures that contain it.

The search can be optionally limited to organic or inorganic structures.

# Angle

The function of the OChemDb 'Angle' main page is to search for bond angles. A table makes available all the bond angles identified and stored in the database (the current number is 29 770), each one specified by the three bonded atomic species which form it.

The bond-angle search is organized in away similar to the bond-distance search. The basic survey requires that the triad of bonded atoms is specified and/or their first neighbours and/or their numbers of oxidation and/or the minimum- and maximum-angle values.

The result of the search is a list which contains all the values of the required bond angle present in the database and, for each angle value(A), the number of the corresponding database card (NA), the first-order neighbours bonded to the three atoms involved in the angle (B), the chemical formula (F) and the space group

# Torsion

The OChemDb 'Torsion' main page can be used for investigating free torsion angles contained in the database.

A table containing all the torsions in the database (the current number is 636) is shown and the graphic and computational tools supporting the 'Angle' page are valid here too.

The search options and the output of results are organized similarly to the case of bond distances and angles.

In the torsion distribution, the mean value is evaluated by using the von Mises function (von Mises, 1918), suitable to describe circular variables.

Since the sign of torsion is relevant only for a small percentage of structures, we plot the absolute values to give a more interpretable representation (particularly when the multi-modal case occurs)

# Space group

The OChemDb 'Space Group' main page is practical for searching space groups.

The frequency in the OChemDb database of each of the 230 space groups is plotted and ranked in a table.

The number of database crystal structures corresponding to each of the seven crystal systems (trigonal hexagonal and trigonal rhombohedral are separated) is also given

It is possible to execute a search under the restraining condition of organic or inorganic compounds. Moreover, an additional filter can be applied to select only the chiral space groups.

# Card

The function of the OChemDb Card main page is to search for a card in the database by supplying its identifying seven-digit number.

When the card is found, its content is shown: graphical visualization of both the crystal structure by JSmol and the structural formula by JSME, general information depending on the corresponding COD CIF content, and all bond distances, bond angles and torsions in the crystal structure.

Statistics on bond distances, angles and torsions can be graphically acquired by searching in a general way or specified by the current atom types

# Type

This tool is operative for two actions:

- (i) editing and searching for a specified atom type and
- (ii) drawing a molecular model by JSME, generating the atom type for each atom in the model and searching for one of the types.

The exact atom type is sought in the database.

## Other pages

### Data access

The user can select this option to retrieve information on bulk data generated by OChemDb. The RESTful architectural style has been adopted for implementing data access. In the current version, only a subset of the overall database information can be queried

## Example 2: K<sub>2</sub>SO<sub>4</sub> (potassium sulphate)

We used the 'Basic' search by choosing K (potassium) as Atom 1 and O (oxygen) as Atom 2 and, allowing a detailed searching, we specified the first neighbours of K (O) and O (S).

## Example 2: K<sub>2</sub>SO<sub>4</sub> (potassium sulphate)

We used the 'Basic' search by choosing K (potassium) as Atom 1 and O (oxygen) as Atom 2 and, allowing a detailed searching, we specified the first neighbours of K (O) and O (S).

We obtained 530 crystal structures containing 4934 K-O bonds with the specified atomic environment;

## Example 2: K<sub>2</sub>SO<sub>4</sub> (potassium sulphate)

We used the 'Basic' search by choosing K (potassium) as Atom 1 and O (oxygen) as Atom 2 and, allowing a detailed searching, we specified the first neighbours of K (O) and O (S).

We obtained 530 crystal structures containing 4934 K-O bonds with the specified atomic environment;

The first ranked database card number 1000049 corresponds to the potassium sulphate structure with K-O bond different distances in the unit cell

# Final remarks

- OChemDb is free for academic use and is available at <http://www.ba.ic.cnr.it/ochemdb/> after registration.
- OChemDb, easy to use, requires only a web browser and an internet connection. Every device (mobile or desktop) and every operating system is able to use OChemDb by accessing to its web page.
- The system is in progress and the authors would like to encourage interested Users to join their effort and to provide suggestions.
